

# ContextHub — OKRs & KPIs

## Objectives & Key Results

### Objective

Validate that ContextHub solves a real, paying problem for multi-tool technical researchers before the end of quarter.

|             | Key Result                                                                                                                                                                                | Score                     |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| <b>O</b>    | Establish ContextHub as a high-utility knowledge bridge for LLM power users.                                                                                                              | 0.5                       |
| <b>KR 1</b> | Recruit and interview 20 additional ICP-profile participants (grad students / post-docs, 3+ LLM tools, 15+ hrs/wk, existing workaround). Use workaround sophistication as primary screen. | 0.0 — Haven't started yet |
| <b>KR 2</b> | Achieve $\geq 70\%$ beta sign-up intent among ICP-screened participants (current unfiltered baseline: 58%).                                                                               | 0.3 — Can't measure yet   |
| <b>KR 3</b> | Achieve $\geq 40\%$ willingness to pay at \$10/month among ICP-screened participants (current unfiltered: 34%; ICP subset trends higher).                                                 | 0.3 — Can't measure yet   |

## Key Performance Indicators

| KPI                           | Details & Measurement                                                                                                                                                                             | Target                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <b>Push rate</b>              | Pushes per active user per week. Tracked passively via event log. Leading indicator that users are committing conversations.                                                                      | $\geq 3$ / user / week     |
| <b>Pull rate</b>              | Pulls per active user per week. Confirms the retrieval loop is being used, not just pushes.                                                                                                       | $\geq 1$ pull per 2 pushes |
| <b>Cross-platform pull %</b>  | % of pulls landing in a different platform than the push origin. Core differentiator from Claude Projects — ranked #1 feature by 52% of participants.                                             | $\geq 40\%$ of all pulls   |
| <b>Day-7 retention</b>        | % of users with $\geq 1$ push or pull in week 2 after signup. Leading indicator of habit formation.                                                                                               | $\geq 50\%$                |
| <b>Workaround abandonment</b> | Self-reported at onboarding + 30-day survey: % who stopped using their prior workaround (Notion, screenshots, prompt doc). Workaround sophistication predicted all downstream scores in research. | $\geq 60\%$ at 30 days     |

### Score Key

- 0.0 — Haven't started yet
- 0.3 — Can't measure yet / blocked
- 0.5 — In progress, on track
- 0.7 — Done
- 1.0 — Exceeded the goal
