

KPI Measurement Update

We tested the current version of ContextHub with 20 users and measured the KPIs that were possible with the current product scope. Since the current version does not yet include cross-platform push/pull, we did not measure cross-platform pull %. We also did not measure 30-day workaround abandonment because the testing period was shorter than 30 days.

KPI Results

KPI	Target	Measured Result	Status
Push rate	≥ 3 pushes / user / week	4.3 pushes / user / week	Met
Pull rate	≥ 1 pull per 2 pushes	1 pull per 2.2 pushes	Close to target
Cross-platform pull %	$\geq 40\%$ of pulls	Not measured	Not in current version
Day-7 retention	$\geq 50\%$	85%	Met
Workaround abandonment	$\geq 60\%$ at 30 days	Not measured	Not enough time for 30-day follow-up

Qualitative Feedback

Several users said ContextHub was useful for organizing important chat histories in one place. Users especially liked being able to pull summaries from several saved conversations with only a few clicks.

Some users did not find the current version as useful because it does not yet support cross-platform workflows. These users said that if they only use one LLM platform, they do not feel a strong need for ContextHub yet.

Takeaways

The current version shows promising early engagement. Push rate and Day-7 retention exceeded our targets, and pull rate was close to target. The strongest product signal is that users value ContextHub when they have many useful AI conversations to organize and reuse.

The biggest learning is that cross-platform support is important to the value proposition. Users who work across Claude, ChatGPT, Gemini, Cursor, or other tools are more likely to see ContextHub as necessary, while single-platform users see less urgency.
